Budget Planner with Data Visualizations

Prepared by: Abinaya S (edit if required)

Introduction

A budget planner helps users understand how money is earned and spent. This project provides a browser-based dashboard for recording monthly income and expenses.

Abstract

Users add transactions with a description, amount, type, category and date. The application calculates monthly totals and balance, displays category-wise spending and tracks a savings goal. Data is stored locally in the browser.

Tools Used

HTML5, CSS3, vanilla JavaScript, Canvas API and localStorage.

Steps Involved in Building the Project

1. Designed a dashboard with income, expense and balance cards.
2. Created a transaction form with amount, category, type and date.
3. Stored transactions in localStorage and filtered them by month.
4. Calculated totals and drew a category-wise bar chart using Canvas.
5. Added savings-goal progress and transaction deletion.

Conclusion

The project demonstrates form handling, calculations, data visualization and browser storage. It is a learning prototype, not a banking or financial-advice application.
